

Fendona[®]

Insecticide

Effective Use for the Greatest Value.

Fendona[®] should be thoroughly mixed with water to give the required concentration. Treated surfaces should be thoroughly sprayed to the point of minimal run-off, ensuring uniform coverage and paying attention to those areas where insects are most likely to come into contact with the insecticide. It can be applied with a knapsack sprayer or other conventional spray equipment. A higher volume of water may be required on very absorbent surfaces.

Pest	Treatment	Required Product Per 5 Liter Water
Flying and crawling insects	Routine	100 ml
	Heavy infestation / extended persistence	200 ml
Stored products pests Residual Surface Treatment	Routine	150 ml
	Extended persistence	300 ml

Critical comments

For crawling insects, apply as a coarse low pressure spray to areas where pests frequent. For flying insects, apply as a surface treatment using a fine spray to wet the surface. Apply 5L of diluted spraymix per 100 square metres for best results.

Re-application period: Up to 30 days or as needed

IMPORTANT INFORMATION

THIS IS NOT THE LABEL AND USERS SHOULD REFER TO THE PRODUCT LABEL FOR FULL DETAILS.

- Provide high performance, low dose formulation
- Excellent broad spectrum insect control
- Rapid knockdown and reliable residual action
- Easy, acceptable and low risk in use

Pest Control Solutions

Fendona[®]

Insecticide

Fendona[®] is a core weapon in the professional pest control armoury for its rapid and reliable action, broad activity and low risk acceptability.

Fendona is active against a wide range of crawling insects by both contact and ingestion for effective control at low dose rates.

Fendona stands out from other synthetic pyrethroid sprays for the efficacy and stability of its advanced micro-crystalline particle formulation.

Fendona is quick and easy to apply, with an environmental profile that makes it especially suitable for insect control in sensitive locations both, indoors and outdoors.

Proven High Performance, Low Dose Formulation

Fendona[®] Insecticide is a alpha-cypermethrin formulation containing 15g/L of the synthetic pyrethroid active. It is effective against a wide range of problem and nuisance insects in a specialist suspension concentrate formulation.

Micro-crystalline particles of active ingredient adhere to many different types of surfaces, including bare and painted wood, glass, brick, concrete and masonry.

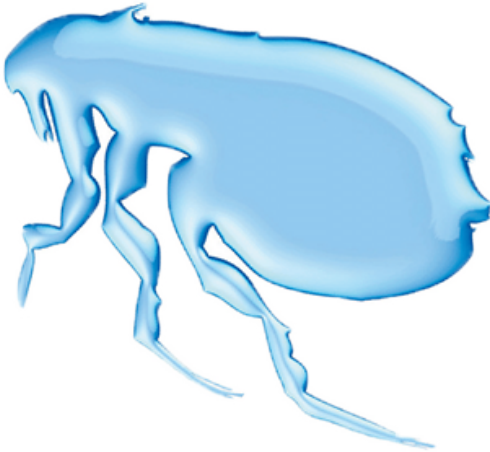

The advanced formulation further ensures dependable results at exceptionally low doses, for maximum application convenience and minimum total treatment cost.

Rapid Knockdown and Reliable Residual Action

Fendona has earned its insect control reputation by combining speed of action with its reliable residual activity.

Its micro-particles cling to the feet and antennae, sensitising insects within the first few minutes of contact. This causes irritation and grooming in an attempt to remove the insecticide, increasing exposure through both contact and ingestion. Excellent bio-absorption of the fat-soluble active leads to **knockdown in as little as 30 minutes and death within 24 hours, and in many situations Fendona keeps on working months after treatment.**

Easy, Acceptable and Low Risk in Use

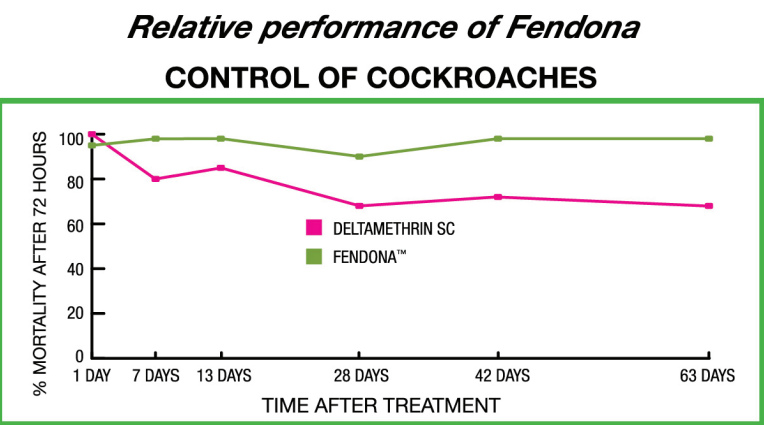

Fendona is easy to dilute and apply through any type of hand operated pneumatic or motorised sprayer equipment and can be used with confidence in combination or rotation with other insecticide classes to combat resistance development.

As well as being odourless and non-staining, it has a relatively low toxicity to humans and other domestic animals, making **Fendona** especially suitable for use in sensitive locations close to people, pets and foodstuffs. Please note however it is toxic to fish, and care should be taken to ensure that the product or prepared spray does not contaminate fish tanks, ponds or waterways.

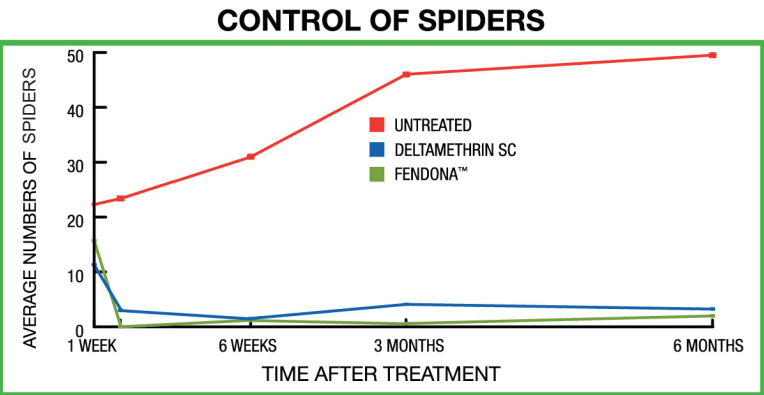

Excellent Broad-Spectrum Insect Control

Fendona is recommended for controlling just about any crawling insect in domestic, highly effective control of ants, cockroaches, mosquitoes and flour beetles.

Fendona is suitable for the control of crawling insects, and flying insects which rest on treated surfaces. When used as directed, it may be safely applied indoors, as well as outdoors on walls, eaves, pergolas, fences, etc.

Studies of the activity of Fendona formulations against a range of pests, Price and Pritchard, 1987.

Summary of 10 field trials on web spinning spiders in buildings in Sydney, Miller and Peters, 1989.
